

# Kaplansky Density for automorphism groups

Matthew Daws

UCLan

Glasgow, May 2019

# Outline

- 1 Operator algebras
- 2 One parameter automorphism groups
- 3 Interlude: Motivation
- 4 Kaplansky density for automorphism groups

# Operator algebras

A  $C^*$ -algebra is either:

- A norm closed, self-adjoint, subalgebra  $A$  of  $\mathcal{B}(H)$  (algebra of bounded operators on a Hilbert space).
- A Banach algebra  $A$  with an involution  $*$  with  $\|a^*a\| = \|a\|^2$  for  $a \in A$ .

A von Neumann algebra is either:

- A SOT closed, self-adjoint, subalgebra  $M$  of  $\mathcal{B}(H)$ .  
So if  $(x_i)$  a net in  $M$ , and  $x \in \mathcal{B}(H)$ , with  $\|x_i(\xi) - x(\xi)\| \rightarrow 0$  for  $\xi \in H$ , then  $x \in M$ .
- A  $C^*$ -algebra  $M$  which is isometrically isomorphic to the dual of some Banach space  $M_*$ .

# Operator algebras

A  $C^*$ -algebra is either:

- A norm closed, self-adjoint, subalgebra  $A$  of  $\mathcal{B}(H)$  (algebra of bounded operators on a Hilbert space).
- A Banach algebra  $A$  with an involution  $*$  with  $\|a^*a\| = \|a\|^2$  for  $a \in A$ .

A von Neumann algebra is either:

- A SOT closed, self-adjoint, subalgebra  $M$  of  $\mathcal{B}(H)$ .  
So if  $(x_i)$  a net in  $M$ , and  $x \in \mathcal{B}(H)$ , with  $\|x_i(\xi) - x(\xi)\| \rightarrow 0$  for  $\xi \in H$ , then  $x \in M$ .
- A  $C^*$ -algebra  $M$  which is isometrically isomorphic to the dual of some Banach space  $M_*$ .

## Trace class operators

Let  $\mathcal{T}(H)$  be the space of trace-class operators on  $H$ : those  $x \in \mathcal{B}(H)$  for which  $|x|$  has finite trace,  $\text{tr}(|x|) < \infty$ .

For  $\xi, \eta \in H$  let  $\theta_{\xi, \eta} \in \mathcal{T}(H)$  be the rank-one operator

$$\theta_{\xi, \eta}(\gamma) = (\gamma|\eta)\xi \quad (\gamma \in H).$$

There is a dual pairing between  $\mathcal{T}(H)$  and  $\mathcal{B}(H)$ :

$$\langle x, y \rangle = \text{tr}(xy) \quad (x \in \mathcal{B}(H), y \in \mathcal{T}(H)).$$

- Under this,  $\mathcal{B}(H)$  is the dual space of  $\mathcal{T}(H)$ .
- Under this,  $\theta_{\xi, \eta}$  induces the “vector functional”  $\omega_{\xi, \eta}$  on  $\mathcal{B}(H)$ :

$$\langle x, \omega_{\xi, \eta} \rangle = \text{tr}(x\theta_{\xi, \eta}) = (\eta|x(\xi)) \quad (x \in \mathcal{B}(H)).$$

## Trace class operators

Let  $\mathcal{T}(H)$  be the space of trace-class operators on  $H$ : those  $x \in \mathcal{B}(H)$  for which  $|x|$  has finite trace,  $\text{tr}(|x|) < \infty$ .

For  $\xi, \eta \in H$  let  $\theta_{\xi, \eta} \in \mathcal{T}(H)$  be the rank-one operator

$$\theta_{\xi, \eta}(\gamma) = (\gamma|\eta)\xi \quad (\gamma \in H).$$

There is a dual pairing between  $\mathcal{T}(H)$  and  $\mathcal{B}(H)$ :

$$\langle x, y \rangle = \text{tr}(xy) \quad (x \in \mathcal{B}(H), y \in \mathcal{T}(H)).$$

- Under this,  $\mathcal{B}(H)$  is the dual space of  $\mathcal{T}(H)$ .
- Under this,  $\theta_{\xi, \eta}$  induces the “vector functional”  $\omega_{\xi, \eta}$  on  $\mathcal{B}(H)$ :

$$\langle x, \omega_{\xi, \eta} \rangle = \text{tr}(x\theta_{\xi, \eta}) = (\eta|x(\xi)) \quad (x \in \mathcal{B}(H)).$$

## Trace class operators

Let  $\mathcal{T}(H)$  be the space of trace-class operators on  $H$ : those  $x \in \mathcal{B}(H)$  for which  $|x|$  has finite trace,  $\text{tr}(|x|) < \infty$ .

For  $\xi, \eta \in H$  let  $\theta_{\xi, \eta} \in \mathcal{T}(H)$  be the rank-one operator

$$\theta_{\xi, \eta}(\gamma) = (\gamma|\eta)\xi \quad (\gamma \in H).$$

There is a dual pairing between  $\mathcal{T}(H)$  and  $\mathcal{B}(H)$ :

$$\langle x, y \rangle = \text{tr}(xy) \quad (x \in \mathcal{B}(H), y \in \mathcal{T}(H)).$$

- Under this,  $\mathcal{B}(H)$  is the dual space of  $\mathcal{T}(H)$ .
- Under this,  $\theta_{\xi, \eta}$  induces the “vector functional”  $\omega_{\xi, \eta}$  on  $\mathcal{B}(H)$ :

$$\langle x, \omega_{\xi, \eta} \rangle = \text{tr}(x\theta_{\xi, \eta}) = (\eta|x(\xi)) \quad (x \in \mathcal{B}(H)).$$

## Trace class operators

Let  $\mathcal{T}(H)$  be the space of trace-class operators on  $H$ : those  $x \in \mathcal{B}(H)$  for which  $|x|$  has finite trace,  $\text{tr}(|x|) < \infty$ .

For  $\xi, \eta \in H$  let  $\theta_{\xi, \eta} \in \mathcal{T}(H)$  be the rank-one operator

$$\theta_{\xi, \eta}(\gamma) = (\gamma|\eta)\xi \quad (\gamma \in H).$$

There is a dual pairing between  $\mathcal{T}(H)$  and  $\mathcal{B}(H)$ :

$$\langle x, y \rangle = \text{tr}(xy) \quad (x \in \mathcal{B}(H), y \in \mathcal{T}(H)).$$

- Under this,  $\mathcal{B}(H)$  is the dual space of  $\mathcal{T}(H)$ .
- Under this,  $\theta_{\xi, \eta}$  induces the “vector functional”  $\omega_{\xi, \eta}$  on  $\mathcal{B}(H)$ :

$$\langle x, \omega_{\xi, \eta} \rangle = \text{tr}(x\theta_{\xi, \eta}) = (\eta|x(\xi)) \quad (x \in \mathcal{B}(H)).$$

## Trace class operators

Let  $\mathcal{T}(H)$  be the space of trace-class operators on  $H$ : those  $x \in \mathcal{B}(H)$  for which  $|x|$  has finite trace,  $\text{tr}(|x|) < \infty$ .

For  $\xi, \eta \in H$  let  $\theta_{\xi, \eta} \in \mathcal{T}(H)$  be the rank-one operator

$$\theta_{\xi, \eta}(\gamma) = (\gamma|\eta)\xi \quad (\gamma \in H).$$

There is a dual pairing between  $\mathcal{T}(H)$  and  $\mathcal{B}(H)$ :

$$\langle x, y \rangle = \text{tr}(xy) \quad (x \in \mathcal{B}(H), y \in \mathcal{T}(H)).$$

- Under this,  $\mathcal{B}(H)$  is the dual space of  $\mathcal{T}(H)$ .
- Under this,  $\theta_{\xi, \eta}$  induces the “vector functional”  $\omega_{\xi, \eta}$  on  $\mathcal{B}(H)$ :

$$\langle x, \omega_{\xi, \eta} \rangle = \text{tr}(x\theta_{\xi, \eta}) = (\eta|x(\xi)) \quad (x \in \mathcal{B}(H)).$$

# Preduals

- We often write  $\mathcal{B}(H)_*$  for  $\mathcal{T}(H)$  as  $\mathcal{T}(H)$  is the *predual* of  $\mathcal{B}(H)$ .
- Given a von Neumann algebra  $M \subseteq \mathcal{B}(H)$ , that  $M$  is SOT closed means that...
- $M$  is closed in  $\mathcal{B}(H)$  for the weak\*-topology induced by  $\mathcal{B}(H)_*$ .
- Equivalently,  $M = (\perp M)^\perp$  where

$$\perp M = \{\omega \in \mathcal{B}(H)_* : \langle x, \omega \rangle = 0 \ (x \in M)\}.$$

- Equivalently (Hahn-Banach) the quotient  $M_* = \mathcal{B}(H)_*/\perp M$  is the predual of  $M$ :

$$(\mathcal{B}(H)_*/\perp M)^* = (\perp M)^\perp = M.$$

- Conversely, if  $M$  is a  $C^*$ -algebra with a predual  $M_*$ , a GNS type argument shows that there is  $H$  with  $M \subseteq \mathcal{B}(H)$  and  $M_* \cong \mathcal{B}(H)_*/\perp M$ .

## Preduals

# Kaplansky Density

## Theorem (Kaplansky)

*Let  $M$  be a von Neumann algebra, and  $A \subseteq M$  be a  $C^*$ -algebra which is weak\*-dense in  $M$ . Then the unit ball of  $A$  is weak\*-dense in the unit ball of  $M$ .*

## How could this fail?

Consider a Hilbert space  $H$  with orthonormal basis  $(e_n)$ . Think of  $x \in \mathcal{B}(H)$  as an infinite matrix  $(x_{ij})$ . Let  $\omega$  be a state on  $\mathcal{B}(H)$  which annihilates all compact operators. Finally, set

$$X = \{x \in \mathcal{B}(H) : 2x_{11} = \omega(x)\}.$$

### Claim

*The weak\*-closure of  $X$  equals all of  $\mathcal{B}(H)$ .*

### Sketch.

The compacts are weak\*-dense in  $\mathcal{B}(H)$ , so approximate  $x \in \mathcal{B}(H)$  by a compact. Then fiddle what happens to the  $(1,1)$  matrix entry, by adding a multiple of the identity, to get inside  $X$ . □

## How could this fail, cont.

$$X = \{x \in \mathcal{B}(H) : 2x_{11} = \omega(x)\}.$$

- If  $x$  is in the unit ball of  $X$  then  $2|x_{11}| = |\omega(x)| \leq \|x\| \leq 1$  (as  $\omega$  is a state). So  $|x_{11}| \leq 1/2$ .
- As evaluating a matrix entry is weak\*-continuous, any  $x$  in the weak\*-closure of the unit ball of  $X$  has  $|x_{11}| \leq 1/2$ .
- Thus the unit ball of  $X$  is not weak\*-dense in the unit ball of  $\mathcal{B}(H)$ .
- But there is some sort of norm control. Q: Is this necessary?

## How could this fail, cont.

$$X = \{x \in \mathcal{B}(H) : 2x_{11} = \omega(x)\}.$$

- If  $x$  is in the unit ball of  $X$  then  $2|x_{11}| = |\omega(x)| \leq \|x\| \leq 1$  (as  $\omega$  is a state). So  $|x_{11}| \leq 1/2$ .
- As evaluating a matrix entry is weak\*-continuous, any  $x$  in the weak\*-closure of the unit ball of  $X$  has  $|x_{11}| \leq 1/2$ .
- Thus the unit ball of  $X$  is not weak\*-dense in the unit ball of  $\mathcal{B}(H)$ .
- But there is some sort of norm control. Q: Is this necessary?

## Algebra example

For any subspace  $Y \subseteq \mathcal{B}(H)$  let

$$S_Y = \left\{ \begin{pmatrix} \alpha & x \\ 0 & \alpha \end{pmatrix} : \alpha \in \mathbb{C}, x \in Y \right\} \subseteq \mathcal{B}(H \oplus H) = M_2(\mathcal{B}(H)).$$

- This is a subalgebra, but not self-adjoint.
- The weak\*-closure of  $S_Y$  is  $S_{\overline{Y}}$ , where  $\overline{Y}$  is the weak\*-closure of  $Y$  in  $\mathcal{B}(H)$ .
- So  $S_X$  is weak\*-dense in  $S_{\mathcal{B}(H)}$ .
- If  $\begin{pmatrix} \alpha & x \\ 0 & \alpha \end{pmatrix}$  is in the unit ball of  $S_X$  then  $\|x\| \leq 1$ . And so  $|x_{11}| \leq 1/2$ .
- So the weak\*-closure of the unit ball of  $S_X$  does not contain  $\begin{pmatrix} 0 & 1 \\ 0 & 0 \end{pmatrix}$ , for example.

# Outline

- 1 Operator algebras
- 2 One parameter automorphism groups**
- 3 Interlude: Motivation
- 4 Kaplansky density for automorphism groups

# Automorphism groups

## Definition

Let  $E$  be a Banach space. A one-parameter group of isometries of  $E$  is a family  $(\alpha_t)_{t \in \mathbb{R}}$  with:

- Each  $\alpha_t$  is a contraction in  $\mathcal{B}(E)$ ;
- $\alpha_0 = 1$ ;
- $\alpha_{t+s} = \alpha_t \circ \alpha_s$  for  $s, t \in \mathbb{R}$ .

Then  $\alpha_{-t} \circ \alpha_t = \alpha_t \circ \alpha_{-t} = \alpha_0 = 1$  so each  $\alpha_t$  is a bijective isometry. Say that  $(\alpha_t)$  is *strongly-continuous* or a  $C_0$ -group if

$$\lim_{t \rightarrow 0} \|\alpha_t(x) - x\| = 0 \quad (x \in E).$$

Equivalently,  $\mathbb{R} \rightarrow E, t \mapsto \alpha_t(x)$  is (norm) continuous.

# Automorphism groups

## Definition

Let  $E$  be a Banach space. A one-parameter group of isometries of  $E$  is a family  $(\alpha_t)_{t \in \mathbb{R}}$  with:

- Each  $\alpha_t$  is a contraction in  $\mathcal{B}(E)$ ;
- $\alpha_0 = 1$ ;
- $\alpha_{t+s} = \alpha_t \circ \alpha_s$  for  $s, t \in \mathbb{R}$ .

Then  $\alpha_{-t} \circ \alpha_t = \alpha_t \circ \alpha_{-t} = \alpha_0 = 1$  so each  $\alpha_t$  is a bijective isometry. Say that  $(\alpha_t)$  is *strongly-continuous* or a  $C_0$ -group if

$$\lim_{t \rightarrow 0} \|\alpha_t(x) - x\| = 0 \quad (x \in E).$$

Equivalently,  $\mathbb{R} \rightarrow E, t \mapsto \alpha_t(x)$  is (norm) continuous.

## Examples

Let  $E = H$  a Hilbert space, so that each  $\alpha_t$  is a unitary on  $H$ .

### Theorem (Stone)

*There is an (unbounded) self-adjoint operator  $T$  with  $\alpha_t = \exp(iTt)$  for  $t \in \mathbb{R}$ .*

Let  $T \in \mathbb{M}_n$  be self-adjoint, so  $u_t = \exp(iTt)$  forms a 1-parameter unitary group on  $\mathbb{C}^n$ . For  $x \in \mathbb{M}_n$  define

$$\alpha_t(x) = u_t x u_{-t} = e^{iTt} x e^{-iTt} \quad (x \in \mathbb{M}_n).$$

- Each  $\alpha_t$  is an isometry for the operator norm.
- $(\alpha_t)$  is a 1-parameter group.
- Each  $\alpha_t$  is a  $*$ -automorphism of the algebra  $\mathbb{M}_n$ .

## Examples

Let  $E = H$  a Hilbert space, so that each  $\alpha_t$  is a unitary on  $H$ .

### Theorem (Stone)

*There is an (unbounded) self-adjoint operator  $T$  with  $\alpha_t = \exp(iTt)$  for  $t \in \mathbb{R}$ .*

Let  $T \in \mathbb{M}_n$  be self-adjoint, so  $u_t = \exp(iTt)$  forms a 1-parameter unitary group on  $\mathbb{C}^n$ . For  $x \in \mathbb{M}_n$  define

$$\alpha_t(x) = u_t x u_{-t} = e^{iTt} x e^{-iTt} \quad (x \in \mathbb{M}_n).$$

- Each  $\alpha_t$  is an isometry for the operator norm.
- $(\alpha_t)$  is a 1-parameter group.
- Each  $\alpha_t$  is a  $*$ -automorphism of the algebra  $\mathbb{M}_n$ .

## Examples cont.

Consider  $C_0(\mathbb{R})$ , the  $C^*$ -algebra of continuous functions  $f : \mathbb{R} \rightarrow \mathbb{C}$  with  $\lim_{|t| \rightarrow \infty} f(t) = 0$ .

- Define  $\alpha_t(f)$  to be the function  $s \mapsto f(s - t)$ .
- Then  $(\alpha_t)$  is a 1-parameter group of  $*$ -automorphisms of  $C_0(\mathbb{R})$ .

Let  $L^\infty(\mathbb{R})$  be the von Neumann algebra of (equivalence classes) of (essentially) bounded measurable functions  $f : \mathbb{R} \rightarrow \mathbb{C}$ .

- Define  $\alpha_t(f)$  to be the function  $s \mapsto f(s - t)$ .
- Then  $(\alpha_t)$  is a 1-parameter group of  $*$ -automorphisms of  $L^\infty(\mathbb{R})$ , continuous in the weak\* sense.

Notice that  $C_0(\mathbb{R})$  is weak\*-dense in  $L^\infty(\mathbb{R})$ , and that the automorphism groups are compatible with this inclusion.

## Examples cont.

Consider  $C_0(\mathbb{R})$ , the  $C^*$ -algebra of continuous functions  $f : \mathbb{R} \rightarrow \mathbb{C}$  with  $\lim_{|t| \rightarrow \infty} f(t) = 0$ .

Notice that  $C_0(\mathbb{R})$  is weak\*-dense in  $L^\infty(\mathbb{R})$ , and that the automorphism groups are compatible with this inclusion.

## Analytic generators: Holomorphic functions

Let  $E$  be a Banach space,  $D \subseteq \mathbb{C}$  a domain, and  $f : D \rightarrow E$  a function. The following are equivalent:

- $f$  is *analytic* in the sense that for each  $\alpha \in D$  there is an absolutely convergence power series for  $f$ , near  $\alpha$ :

$$f(z) = \sum_{n \geq 0} a_n (z - \alpha)^n \quad |z - \alpha| < r.$$

- $f$  is holomorphic, in the sense that there is  $F \subseteq E^*$  norming, with  $D \rightarrow \mathbb{C}; z \mapsto \phi(f(z))$  is differentiable, for each  $\phi \in F$ .

Here *norming* means that

$$\|x\| = \sup\{|\phi(x)| : \phi \in F\} \quad (x \in E).$$

In particular, “weakly holomorphic” or “weak\*-holomorphic” imply “norm analytic”.

## Analytic generators: Holomorphic functions

Let  $E$  be a Banach space,  $D \subseteq \mathbb{C}$  a domain, and  $f : D \rightarrow E$  a function. The following are equivalent:

- $f$  is *analytic* in the sense that for each  $\alpha \in D$  there is an absolutely convergence power series for  $f$ , near  $\alpha$ :

$$f(z) = \sum_{n \geq 0} a_n (z - \alpha)^n \quad |z - \alpha| < r.$$

- $f$  is holomorphic, in the sense that there is  $F \subseteq E^*$  norming, with  $D \rightarrow \mathbb{C}; z \mapsto \phi(f(z))$  is differentiable, for each  $\phi \in F$ .

Here *norming* means that

$$\|x\| = \sup\{|\phi(x)| : \phi \in F\} \quad (x \in E).$$

In particular, “weakly holomorphic” or “weak\*-holomorphic” imply “norm analytic”.

# Analytic generators: Regular functions

Given  $\alpha \in \mathbb{C}$  let

$$S(\alpha) = \left\{ z \in \mathbb{C} : \begin{array}{ll} 0 \leq \operatorname{Im}(z) \leq \operatorname{Im}(\alpha) & \text{if } \operatorname{Im}(\alpha) \geq 0 \\ 0 \geq \operatorname{Im}(z) \geq \operatorname{Im}(\alpha) & \text{if } \operatorname{Im}(\alpha) \leq 0 \end{array} \right\}.$$

That is, the closed horizontal strip bounded by  $\mathbb{R}$  and  $\mathbb{R} + \alpha$ .

A function  $f : S(\alpha) \rightarrow E$  is *regular* if  $f$  is continuous, analytic in the interior of  $S(\alpha)$ , and bounded on  $\mathbb{R}$  and  $\mathbb{R} + \alpha$ :

$$M := \sup_{t \in \mathbb{R}} \max (\|f(t)\|, \|f(\alpha + t)\|) < \infty.$$

The 3-Lines Theorem shows that then  $\|f(z)\| \leq M$  for all  $z \in S(\alpha)$ .  
Some link with complex interpolation?

# Analytic generators: Regular functions

Given  $\alpha \in \mathbb{C}$  let

$$S(\alpha) = \left\{ z \in \mathbb{C} : \begin{array}{ll} 0 \leq \operatorname{Im}(z) \leq \operatorname{Im}(\alpha) & \text{if } \operatorname{Im}(\alpha) \geq 0 \\ 0 \geq \operatorname{Im}(z) \geq \operatorname{Im}(\alpha) & \text{if } \operatorname{Im}(\alpha) \leq 0 \end{array} \right\}.$$

That is, the closed horizontal strip bounded by  $\mathbb{R}$  and  $\mathbb{R} + \alpha$ .

## Analytic generators: Regular functions

Given  $\alpha \in \mathbb{C}$  let

$$S(\alpha) = \left\{ z \in \mathbb{C} : \begin{array}{ll} 0 \leq \operatorname{Im}(z) \leq \operatorname{Im}(\alpha) & \text{if } \operatorname{Im}(\alpha) \geq 0 \\ 0 \geq \operatorname{Im}(z) \geq \operatorname{Im}(\alpha) & \text{if } \operatorname{Im}(\alpha) \leq 0 \end{array} \right\}.$$

That is, the closed horizontal strip bounded by  $\mathbb{R}$  and  $\mathbb{R} + \alpha$ .

A function  $f : S(\alpha) \rightarrow E$  is *regular* if  $f$  is continuous, analytic in the interior of  $S(\alpha)$ , and bounded on  $\mathbb{R}$  and  $\mathbb{R} + \alpha$ :

$$M := \sup_{t \in \mathbb{R}} \max(\|f(t)\|, \|f(\alpha + t)\|) < \infty.$$

The 3-Lines Theorem shows that then  $\|f(z)\| \leq M$  for all  $z \in S(\alpha)$ .  
Some link with complex interpolation?

## Analytic generators: Regular functions

Given  $\alpha \in \mathbb{C}$  let

$$S(\alpha) = \left\{ z \in \mathbb{C} : \begin{array}{ll} 0 \leq \operatorname{Im}(z) \leq \operatorname{Im}(\alpha) & \text{if } \operatorname{Im}(\alpha) \geq 0 \\ 0 \geq \operatorname{Im}(z) \geq \operatorname{Im}(\alpha) & \text{if } \operatorname{Im}(\alpha) \leq 0 \end{array} \right\}.$$

# Analytic generators

Given  $(\alpha_t)$ , a 1-parameter group on  $E$ , and  $z \in \mathbb{C}$ , define an operator  $D(\alpha_z) \rightarrow E$  by

$$x \in D(\alpha_z) \text{ when there is } f : S(z) \rightarrow E \text{ regular with} \\ f(t) = \alpha_t(x) \text{ } (t \in \mathbb{R}).$$

Then we set  $\alpha_z(x) = f(z)$ .

- Morera's Theorem and the Reflection Principle imply that such an  $f$  is unique. So  $\alpha_z$  is well-defined.
- Think of  $\alpha_z$  as an “analytic extension” of the mapping  $t \mapsto \alpha_t(x)$ .
- Can show that  $D(\alpha_z)$  is dense in  $E$  and that  $\alpha_z$  is *closed*.
- Then  $\alpha_{-i}$  is the *analytic generator* of  $(\alpha_t)$ .

# Analytic generators

- Can show that  $D(\alpha_z)$  is dense in  $E$  and that  $\alpha_z$  is *closed*.
- Then  $\alpha_{-i}$  is the *analytic generator* of  $(\alpha_t)$ .

## Examples

When  $(\alpha_t)$  is a continuous unitary group on a Hilbert space  $H$ , with  $\alpha_t = \exp(iTt)$ , then

$$\alpha_{-i} = \exp(T).$$

Define  $\exp(T)$  by functional calculus. The equality means with equality of domains. (Of course formally obvious; but the LHS and RHS have different definitions.)

If  $(\alpha_t)$  on  $M_n$  is

$$\alpha_t(x) = u_t x u_{-t} = e^{iTt} x e^{-iTt},$$

then

$$\alpha_{-i}(x) = e^T x e^{-T} = P x P^{-1},$$

where  $P = e^T$  is the analytic generator of  $(u_t)$ .

## Examples

When  $(\alpha_t)$  is a continuous unitary group on a Hilbert space  $H$ , with  $\alpha_t = \exp(iTt)$ , then

$$\alpha_{-i} = \exp(T).$$

Define  $\exp(T)$  by functional calculus. The equality means with equality of domains. (Of course formally obvious; but the LHS and RHS have different definitions.)

If  $(\alpha_t)$  on  $\mathbb{M}_n$  is

$$\alpha_t(x) = u_t x u_{-t} = e^{iTt} x e^{-iTt},$$

then

$$\alpha_{-i}(x) = e^T x e^{-T} = P x P^{-1},$$

where  $P = e^T$  is the analytic generator of  $(u_t)$ .

## Some properties

$\alpha_z$  is *closed* in the sense that the *graph*

$$\mathcal{G}(\alpha_z) = \{(x, \alpha_z(x)) : x \in D(\alpha_z)\} \subseteq E \oplus E$$

is closed.

Recall how to compose two unbounded operators

$T : D(T) \rightarrow E, S : D(S) \rightarrow E$ :

$$D(ST) = \{x \in D(T) : T(x) \in D(S)\}; \quad ST : D(ST) \ni x \mapsto S(T(x)).$$

Then  $S = T$  means  $\mathcal{G}(S) = \mathcal{G}(T)$ ; and  $S \subseteq T$  means  $\mathcal{G}(S) \subseteq \mathcal{G}(T)$ .

As closed operators, we have that

- $\alpha_t \circ \alpha_z = \alpha_z \circ \alpha_t = \alpha_{t+z}$
- If  $z, w$  lie on the same side of the real axis, then  $\alpha_z \alpha_w = \alpha_{z+w}$
- In general,  $\alpha_z \alpha_w \subseteq \alpha_{z+w}$ .

## Some properties

$\alpha_z$  is *closed* in the sense that the *graph*

$$\mathcal{G}(\alpha_z) = \{(x, \alpha_z(x)) : x \in D(\alpha_z)\} \subseteq E \oplus E$$

is closed.

Recall how to compose two unbounded operators

$$T : D(T) \rightarrow E, S : D(S) \rightarrow E:$$

$$D(ST) = \{x \in D(T) : T(x) \in D(S)\}; \quad ST : D(ST) \ni x \mapsto S(T(x)).$$

Then  $S = T$  means  $\mathcal{G}(S) = \mathcal{G}(T)$ ; and  $S \subseteq T$  means  $\mathcal{G}(S) \subseteq \mathcal{G}(T)$ .

As closed operators, we have that

- $\alpha_t \circ \alpha_z = \alpha_z \circ \alpha_t = \alpha_{t+z}$
- If  $z, w$  lie on the same side of the real axis, then  $\alpha_z \alpha_w = \alpha_{z+w}$
- In general,  $\alpha_z \alpha_w \subseteq \alpha_{z+w}$ .

## Some properties

$\alpha_z$  is *closed* in the sense that the *graph*

$$\mathcal{G}(\alpha_z) = \{(x, \alpha_z(x)) : x \in D(\alpha_z)\} \subseteq E \oplus E$$

is closed.

Recall how to compose two unbounded operators

$$T : D(T) \rightarrow E, S : D(S) \rightarrow E:$$

$$D(ST) = \{x \in D(T) : T(x) \in D(S)\}; \quad ST : D(ST) \ni x \mapsto S(T(x)).$$

Then  $S = T$  means  $\mathcal{G}(S) = \mathcal{G}(T)$ ; and  $S \subseteq T$  means  $\mathcal{G}(S) \subseteq \mathcal{G}(T)$ .

As closed operators, we have that

- $\alpha_t \circ \alpha_z = \alpha_z \circ \alpha_t = \alpha_{t+z}$
- If  $z, w$  lie on the same side of the real axis, then  $\alpha_z \alpha_w = \alpha_{z+w}$
- In general,  $\alpha_z \alpha_w \subseteq \alpha_{z+w}$ .

## Examples, cont.

$$\alpha_t(f)(s) = f(s - t) \quad (s, t \in \mathbb{R}, f \in C_0(\mathbb{R})).$$

- Let  $f \in D(\alpha_{-i})$ ;
- Let  $F : S(-i) \rightarrow C_0(\mathbb{R})$  be the associated regular function.
- Define  $g : S(i) \rightarrow \mathbb{C}$  by  $g(z) = F(-z)(0)$ .
- Then  $g(t) = F(-t)(0) = \alpha_{-t}(f)(0) = f(t)$ .
- Also  $g$  is regular.
- Can reverse this: given regular  $g : S(i) \rightarrow \mathbb{C}$  then define  $F : S(-i) \rightarrow C_0(\mathbb{R})$  by  $F(z)(t) = g(t - z)$ , so that  $F$  becomes a  $C_0(\mathbb{R})$ -valued regular function.

So  $f$  itself analytically extends to  $S(i)$ , and  $F(-i)$  is this extension of  $f$ , evaluated on  $\mathbb{R} + i$ .

(Somehow like a Hardy space...)

## Examples, cont.

$$\alpha_t(f)(s) = f(s - t) \quad (s, t \in \mathbb{R}, f \in C_0(\mathbb{R})).$$

- Let  $f \in D(\alpha_{-i})$ ;
- Let  $F : S(-i) \rightarrow C_0(\mathbb{R})$  be the associated regular function.
- Define  $g : S(i) \rightarrow \mathbb{C}$  by  $g(z) = F(-z)(0)$ .
- Then  $g(t) = F(-t)(0) = \alpha_{-t}(f)(0) = f(t)$ .
- Also  $g$  is regular.
- Can reverse this: given regular  $g : S(i) \rightarrow \mathbb{C}$  then define  $F : S(-i) \rightarrow C_0(\mathbb{R})$  by  $F(z)(t) = g(t - z)$ , so that  $F$  becomes a  $C_0(\mathbb{R})$ -valued regular function.

So  $f$  itself analytically extends to  $S(i)$ , and  $F(-i)$  is this extension of  $f$ , evaluated on  $\mathbb{R} + i$ .

(Somehow like a Hardy space...)

## Examples, cont.

So  $f$  itself analytically extends to  $S(i)$ , and  $F(-i)$  is this extension of  $f$ , evaluated on  $\mathbb{R} + i$ .

(Somehow like a Hardy space...)

## Some properties: $C^*$ -algebra case

Now suppose  $E = A$  is a  $C^*$ -algebra and each  $\alpha_t$  is a  $*$ -automorphism.  
Given  $a, b \in D(\alpha_z)$  with associated regular functions

$$F_a, F_b : S(z) \rightarrow A$$

we can pointwise multiply to obtain

$$F : S(z) \rightarrow A; \quad w \mapsto F_a(w)F_b(w).$$

- $F$  is regular (local power series expansion).
- $F(t) = F_a(t)F_b(t) = \alpha_t(a)\alpha_t(b) = \alpha_t(ab)$  for  $t \in \mathbb{R}$ .
- So  $ab \in D(\alpha_z)$  with  $\alpha_z(ab) = F(z) = \alpha_z(a)\alpha_z(b)$ .

Equivalently, we see that the graph  $\mathcal{G}(\alpha_z)$  is a subalgebra of  $A \oplus A$ .

## Some properties: $C^*$ -algebra case

Now suppose  $E = A$  is a  $C^*$ -algebra and each  $\alpha_t$  is a  $*$ -automorphism. Given  $a, b \in D(\alpha_z)$  with associated regular functions

$$F_a, F_b : S(z) \rightarrow A$$

we can pointwise multiply to obtain

$$F : S(z) \rightarrow A; \quad w \mapsto F_a(w)F_b(w).$$

- $F$  is regular (local power series expansion).
- $F(t) = F_a(t)F_b(t) = \alpha_t(a)\alpha_t(b) = \alpha_t(ab)$  for  $t \in \mathbb{R}$ .
- So  $ab \in D(\alpha_z)$  with  $\alpha_z(ab) = F(z) = \alpha_z(a)\alpha_z(b)$ .

Equivalently, we see that the graph  $\mathcal{G}(\alpha_z)$  is a subalgebra of  $A \oplus A$ .

## Some properties: $C^*$ -algebra case

Now suppose  $E = A$  is a  $C^*$ -algebra and each  $\alpha_t$  is a  $*$ -automorphism. Given  $a, b \in D(\alpha_z)$  with associated regular functions

$$F_a, F_b : S(z) \rightarrow A$$

we can pointwise multiply to obtain

$$F : S(z) \rightarrow A; \quad w \mapsto F_a(w)F_b(w).$$

- $F$  is regular (local power series expansion).
- $F(t) = F_a(t)F_b(t) = \alpha_t(a)\alpha_t(b) = \alpha_t(ab)$  for  $t \in \mathbb{R}$ .
- So  $ab \in D(\alpha_z)$  with  $\alpha_z(ab) = F(z) = \alpha_z(a)\alpha_z(b)$ .

Equivalently, we see that the graph  $\mathcal{G}(\alpha_z)$  is a subalgebra of  $A \oplus A$ .

## Some properties: $C^*$ -algebra case

Now suppose  $E = A$  is a  $C^*$ -algebra and each  $\alpha_t$  is a  $*$ -automorphism. Given  $a, b \in D(\alpha_z)$  with associated regular functions

$$F_a, F_b : S(z) \rightarrow A$$

we can pointwise multiply to obtain

$$F : S(z) \rightarrow A; \quad w \mapsto F_a(w)F_b(w).$$

- $F$  is regular (local power series expansion).
- $F(t) = F_a(t)F_b(t) = \alpha_t(a)\alpha_t(b) = \alpha_t(ab)$  for  $t \in \mathbb{R}$ .
- So  $ab \in D(\alpha_z)$  with  $\alpha_z(ab) = F(z) = \alpha_z(a)\alpha_z(b)$ .

Equivalently, we see that the graph  $\mathcal{G}(\alpha_z)$  is a subalgebra of  $A \oplus A$ .

## Some properties: $C^*$ -algebra case (cont.)

Given  $a \in D(\alpha_{-i})$  with regular  $F : S(-i) \rightarrow A$  define

$$F^* : S(-i) \rightarrow A; \quad w \mapsto F(\overline{w} - i)^*.$$

That is, use the involution on  $A$ .

- $F^*$  is regular (local power series expansion).
- $F^*(t) = F(t - i)^* = (\alpha_t \alpha_{-i}(a))^* = \alpha_t(\alpha_{-i}(a)^*)$  for  $t \in \mathbb{R}$ .
- $F^*(-i) = F(0)^* = a^*$

So  $\alpha_{-i}(a)^* \in D(\alpha_{-i})$  and  $\alpha_{-i}(\alpha_{-i}(a)^*) = a^*$ .

Equivalently  $(a, b) \in \mathcal{G}(\alpha_{-i}) \implies (b^*, a^*) \in \mathcal{G}(\alpha_{-i})$ . So  $\mathcal{G}(\alpha_{-i})$  is a  $*$ -algebra, but for this twisted involution.

## Some properties: $C^*$ -algebra case (cont.)

Given  $a \in D(\alpha_{-i})$  with regular  $F : S(-i) \rightarrow A$  define

$$F^* : S(-i) \rightarrow A; \quad w \mapsto F(\overline{w} - i)^*.$$

That is, use the involution on  $A$ .

- $F^*$  is regular (local power series expansion).
- $F^*(t) = F(t - i)^* = (\alpha_t \alpha_{-i}(a))^* = \alpha_t(\alpha_{-i}(a)^*)$  for  $t \in \mathbb{R}$ .
- $F^*(-i) = F(0)^* = a^*$

So  $\alpha_{-i}(a)^* \in D(\alpha_{-i})$  and  $\alpha_{-i}(\alpha_{-i}(a)^*) = a^*$ .

Equivalently  $(a, b) \in \mathcal{G}(\alpha_{-i}) \implies (b^*, a^*) \in \mathcal{G}(\alpha_{-i})$ . So  $\mathcal{G}(\alpha_{-i})$  is a  $*$ -algebra, but for this twisted involution.

## Some properties: $C^*$ -algebra case (cont.)

Given  $a \in D(\alpha_{-i})$  with regular  $F : S(-i) \rightarrow A$  define

$$F^* : S(-i) \rightarrow A; \quad w \mapsto F(\overline{w} - i)^*.$$

That is, use the involution on  $A$ .

- $F^*$  is regular (local power series expansion).
- $F^*(t) = F(t - i)^* = (\alpha_t \alpha_{-i}(a))^* = \alpha_t(\alpha_{-i}(a)^*)$  for  $t \in \mathbb{R}$ .
- $F^*(-i) = F(0)^* = a^*$

So  $\alpha_{-i}(a)^* \in D(\alpha_{-i})$  and  $\alpha_{-i}(\alpha_{-i}(a)^*) = a^*$ .

Equivalently  $(a, b) \in \mathcal{G}(\alpha_{-i}) \implies (b^*, a^*) \in \mathcal{G}(\alpha_{-i})$ . So  $\mathcal{G}(\alpha_{-i})$  is a  $*$ -algebra, but for this twisted involution.

## Some properties: $C^*$ -algebra case (cont.)

Given  $a \in D(\alpha_{-i})$  with regular  $F : S(-i) \rightarrow A$  define

$$F^* : S(-i) \rightarrow A; \quad w \mapsto F(\overline{w} - i)^*.$$

That is, use the involution on  $A$ .

- $F^*$  is regular (local power series expansion).
- $F^*(t) = F(t - i)^* = (\alpha_t \alpha_{-i}(a))^* = \alpha_t(\alpha_{-i}(a)^*)$  for  $t \in \mathbb{R}$ .
- $F^*(-i) = F(0)^* = a^*$

So  $\alpha_{-i}(a)^* \in D(\alpha_{-i})$  and  $\alpha_{-i}(\alpha_{-i}(a)^*) = a^*$ .

Equivalently  $(a, b) \in \mathcal{G}(\alpha_{-i}) \implies (b^*, a^*) \in \mathcal{G}(\alpha_{-i})$ . So  $\mathcal{G}(\alpha_{-i})$  is a  $*$ -algebra, but for this twisted involution.

# Outline

- 1 Operator algebras
- 2 One parameter automorphism groups
- 3 Interlude: Motivation**
- 4 Kaplansky density for automorphism groups

# Locally compact quantum groups

The Operator algebraic approach to Quantum Groups uses  $C^*$  and von Neumann algebras to generalise the notion of a locally compact group, and Pontryagin duality.

- Write  $\mathbb{G}$  for the “abstract quantum group” and  $L^\infty(\mathbb{G})$  and  $C_0(\mathbb{G})$  for the associated algebras.
- The correct notion of the “group inverse” here is the *antipode*  $S$ , which in interesting examples turns out to be unbounded.
- Can “polar decompose”  $S = R\tau_{-i/2}$  where  $R$  is the *unitary antipode* (and anti- $*$ -automorphism), and...
- $(\tau_t)$  is the *scaling group*, a 1-parameter group of  $*$ -automorphisms of  $L^\infty(\mathbb{G})$ .
- $S^2 = \tau_{-i}$ .

Furthermore,  $S$ ,  $R$  and  $(\tau_t)$  all drop to  $C_0(\mathbb{G})$  which is weak\*-dense in  $L^\infty(\mathbb{G})$ .

## Locally compact quantum groups

- The correct notion of the “group inverse” here is the *antipode*  $S$ , which in interesting examples turns out to be unbounded.
- Can “polar decompose”  $S = R\tau_{-i/2}$  where  $R$  is the *unitary antipode* (and anti- $*$ -automorphism), and...
- $(\tau_t)$  is the *scaling group*, a 1-parameter group of  $*$ -automorphisms of  $L^\infty(\mathbb{G})$ .
- $S^2 = \tau_{-i}$ .

Furthermore,  $S$ ,  $R$  and  $(\tau_t)$  all drop to  $C_0(\mathbb{G})$  which is weak\*-dense in  $L^\infty(\mathbb{G})$ .

## Locally compact quantum groups

The Operator algebraic approach to Quantum Groups uses  $C^*$  and von Neumann algebras to generalise the notion of a locally compact group, and Pontryagin duality.

- Write  $\mathbb{G}$  for the “abstract quantum group” and  $L^\infty(\mathbb{G})$  and  $C_0(\mathbb{G})$  for the associated algebras.
- The correct notion of the “group inverse” here is the *antipode*  $S$ , which in interesting examples turns out to be unbounded.
- Can “polar decompose”  $S = R\tau_{-i/2}$  where  $R$  is the *unitary antipode* (and anti- $*$ -automorphism), and...
- $(\tau_t)$  is the *scaling group*, a 1-parameter group of  $*$ -automorphisms of  $L^\infty(\mathbb{G})$ .
- $S^2 = \tau_{-i}$ .

Furthermore,  $S$ ,  $R$  and  $(\tau_t)$  all drop to  $C_0(\mathbb{G})$  which is weak\*-dense in  $L^\infty(\mathbb{G})$ .

## Von Neumann setting

Each  $\alpha_t$  is normal, and for  $x \in M$ , the orbit map  $R \rightarrow M; t \mapsto \alpha_t(x)$  is weak\*-continuous.

- Form  $\alpha_z$  in the same way, but we only require a weak\*-regular extension.
- (But weak\*-holomorphic implies norm analytic. The extension to the boundary is only weak\*-continuous).
- Then  $\mathcal{G}(\alpha_z)$  is weak\*-closed.
- Still  $\mathcal{G}(\alpha_z)$  is an algebra, and  $\mathcal{G}(\alpha_{-i})$  is a \*-algebra. (Harder to prove, as the product is only *separately* continuous now.)

## Von Neumann setting

# Outline

- 1 Operator algebras
- 2 One parameter automorphism groups
- 3 Interlude: Motivation
- 4 **Kaplansky density for automorphism groups**

# Setup

We will suppose we have:

- a  $C^*$ -algebra  $A$  which is weak\*-dense in a von Neumann algebra  $M$ ;
- A (strongly-continuous) 1-parameter \*-automorphism group  $(\alpha_t^A)$  on  $A$ , which extends to a (weak\*-continuous) 1-parameter \*-automorphism group  $(\alpha_t^M)$  on  $M$ .

So we can consider:

$\alpha_{-i}^A$ : a norm-closed, norm-densely defined operator on  $A$ ,  
 $\alpha_{-i}^M$ : a weak\*-closed, weak\*-densely defined operator on  $M$ .

How are these related?

# Setup

We will suppose we have:

- a  $C^*$ -algebra  $A$  which is weak\*-dense in a von Neumann algebra  $M$ ;
- A (strongly-continuous) 1-parameter  $*$ -automorphism group  $(\alpha_t^A)$  on  $A$ , which extends to a (weak\*-continuous) 1-parameter  $*$ -automorphism group  $(\alpha_t^M)$  on  $M$ .

So we can consider:

$\alpha_{-i}^A$  a norm-closed, norm-densely defined operator on  $A$ ,  
 $\alpha_{-i}^M$  a weak\*-closed, weak\*-densely defined operator on  $M$ .

How are these related?

# Graphs

Almost by definition, we have that  $\alpha_{-i}^M$  extends  $\alpha_{-i}^A$ , which means that

$$\mathcal{G}(\alpha_{-i}^A) \subseteq \mathcal{G}(\alpha_{-i}^M),$$

under the obvious inclusions  $A \oplus A \subseteq M \oplus M$ .

- In fact,  $\mathcal{G}(\alpha_{-i}^A) = \mathcal{G}(\alpha_{-i}^M) \cap (A \oplus A)$ .

One can show that actually

$$\mathcal{G}(\alpha_{-i}^A) \text{ is weak}^* \text{ dense in } \mathcal{G}(\alpha_{-i}^M).$$

In other words,  $\alpha_{-i}^A$  is a (weak\*) core for  $\alpha_{-i}^M$ .

# Graphs

In other words,  $\alpha_{-i}^A$  is a (weak\*) core for  $\alpha_{-i}^M$ .

## Theorem

*The unit ball of  $\mathcal{G}(\alpha_{-i}^A)$  is weak\*-dense in the unit ball of  $\mathcal{G}(\alpha_{-i}^M)$ .*

To be concrete, this means that given  $x \in D(\alpha_{-i}^M)$  with

$$\|x\| \leq 1 \text{ and } \|\alpha_{-i}^M(x)\| \leq 1,$$

there is a net  $(a_j)$  in  $D(\alpha_{-i}^A)$  with  $a_j \rightarrow x$  and  $\alpha_{-i}^A(a_j) \rightarrow \alpha_{-i}^M(x)$  weak\*, and with

$$\|a_j\| \leq 1 \text{ and } \|\alpha_{-i}^A(a_j)\| \leq 1.$$

## Sketch of proof

The key idea is von Neumann algebraic:

- Using Kaplansky density for  $A \subseteq M$  we see that  $A$  norms the predual  $M_*$ .
- Equivalently, the induced map  $M_* \rightarrow A^*$  (given by restricting functions in  $M_*$  to  $A \subseteq M$ ) is an isometry.
- The resulting subspace of  $A^*$  is an  $A$ -bimodule, and so there is a central projection  $z \in A^{**}$  with  $A^*z = M_*$ .
- Thus  $A^{**}z \cong M$ .

We now consider  $\mathcal{G}(\alpha_{-i}^A)^{**} \subseteq A^{**} \oplus A^{**}$ . One can carefully show that

$$\mathcal{G}(\alpha_{-i}^M) \cong \mathcal{G}(\alpha_{-i}^A)^{**}(z \oplus z) \text{ and } \mathcal{G}(\alpha_{-i}^M) \subseteq \mathcal{G}(\alpha_{-i}^A)^{**}.$$

# Open question

Swap things about:

- The adjoints of  $(\alpha_t^A)$  give rise to a weak\*-continuous 1-parameter isometry group on  $A^*$ .
- The pre-adjoints of  $(\alpha_t^M)$  give rise to a norm-continuous 1-parameter isometry group on  $M_*$ .

We have the isometric inclusion  $M_* \rightarrow A^*$  which leads to

$$\mathcal{G}(\alpha_{-i}^{M_*}) \subseteq \mathcal{G}(\alpha_{-i}^{A^*}),$$

which is weak\*-dense.

Does Kaplansky Density hold for this?
